

Final project report

<i>Project ID</i>	2002/6.02
<i>Title</i>	LONA (Lidar Observatories for NDSC in Antarctica)
<i>Principal investigator</i>	Di Donfrancesco Guido
<i>Institution</i>	ENEA-CLIMOSS
<i>Email</i>	guido.didonfrancesco@enea.it
<i>Duration</i>	2 years
<i>Assigned funding</i>	60.000,00 Euro

Activities and results

The main objective of the proposal is related to the ozone loss as well as to the climatic changes, and is constituted by regular semi-automatic monitoring of the Antarctic stratosphere by means of lidar instrumentation, that has been working from many years in Antarctica at McMurdo and Dumond d'Urville stations. Both the stations are part of the Network for Detection of the Stratospheric Change (NDSC).

The activities could be summarized in:

- 1) Continuation of the decennial database of lidar measurements of polar stratospheric aerosol and temperatures;
- 2) Implementation of hardware and software on both the systems to permit semi-automatic measurements and real-time analysis (in collaboration with the French CNRS partner);
- 3) Analysis of the raw data for the NDSC database;
- 4) Complementary measurements, during the polar winter, of balloon borne instrumentation for measurements of ozone and aerosol sizes, in collaboration with University of Wyoming, Prof. Terry Deshler.

The main results of the project are:

- 1) A decennial climatology of PSCs above McMurdo with emphasis on their optical/microphysics properties with respect the formation mechanism;
- 2) An intercomparison of Arctic and Antarctic PSCs;
- 3) A database of optical properties of PSCs with a separation of different cloud types according to their scattering and depolarization values.
