

Final project report

<i>Project ID:</i>	2002/8.01
<i>Title:</i>	CLIMA - Variabilità, processi ed interazioni nel Mare di Ross in relazione alle pulsazioni climatiche
<i>Principal investigator:</i>	prof. Giancarlo Spezie
<i>Institution:</i>	Dipartimento di Scienze per l'Ambiente Università degli Studi di Napoli Parthenope
<i>Email:</i>	giancarlo.spezie@uniparthenope.it
<i>Duration:</i>	2 years
<i>Assigned funding:</i>	€

Activities and results

The CLIMA project, in this third edition, focused on the oceanic ventilation processes which happen at the Ross Sea shelf break, where the interaction between shelf waters and circumpolar water related to Ross Gyre are more obvious and characteristic. The processes of transformation of coastal water masses and their biogeochemical signals associated with these transformations have been studied with particular attention to assessing their response to climatic pulsations in place. The two-year plan has allowed the execution of a single oceanographic campaign in late austral summer.

During December 2002, a researcher of the CLIMA project participated in the field activity of the IVARS (inter Variations in the Ross Sea Antarctica) on the researcher vessel Polar Sea in the framework of the collaboration with the Virginia Marine Institute.

The scientific activity has been carried on in close collaboration with the most extensive program of ANSLOPE SCOR / IANZONE which provides activities in the Ross Sea until 2005 (p.i. A. Gordon of Lamont-Doherty Earth Observatory, Columbia Univ. – USA).

During 2003 the scientific activities were substantially focused on experimental operations on board of oceanographic Italian and foreign ships, on the data processing, and participation in scientific meetings and conferences.

The oceanographic cruise on board the ship Italica were planned for the scientific activities of the Sectors 8 and 9 of the PNRA, it began on January 18 and ended on 18 February 2003 with a total period of 31 days. The field activity may be divided in three periods.

First period

99 XBT launches along the P14 section of WOCE

Launches of 7 surface drifter from the project IPAB; 3 hydrological deep casts, ongoing acquisition of surface temperature (SST) and salinity (SSS) data.

Second period

Mooring activities: mooring D was lost cause iceberg collision, H1 and H2 not recovered for the presence of ice, F1, F2 and H3 not positioned for the presence of ice, L recovered and repositioned, D and G positioned.

Hydrographic activities: 126 casts, and XBT drops in the shelf break area. Ongoing SST and SSS data collection.

Third period

During comeback sailing were partly repeated the activity of the first period, for an assessment of seasonal variability along the same transect.

- a) Launch of XBT near the escarpment of the Campbell Plateau
- b) Measure continuous physical parameters of the surface layer

The observational activity of the CLIMA project continued in March and April 2003 on board the N/R Palmer in partnership with the project AnSlope of Columbia University. Moreover a scientific collaboration with the chemical oceanographic team of the LDEO (Columbia University, New York, USA) to implement a new instrument for the CFC measurements in sea water samples started in 2003 and is still active.
