

Final project report

<i>Project ID</i>	2006/3.01
<i>Title</i>	<i>Integrated analysis of geophysical data to characterize slopes with gas hydrate offshore South Shetland Margin (IGEOS)</i>
<i>Principal investigator</i>	Umberta Tinivella
<i>Institution</i>	Istituto Nazionale di Oceanografia e di Geofisica Sperimentale - OGS
<i>Email</i>	utinivella@ogs.trieste.it
<i>Duration</i>	3 years
<i>Assigned funding</i>	80,000 Euro

Activities and results

IGEOS project aimed at applying integrated methodologies, such as in situ measurements (multibeam, seismic and CHIRP data), laboratory measurements (static and dynamic geotechnical tests) and theoretical models (Biot theory) to obtain a geophysical model of the superficial sedimentary cover that characterizes the South Shetland margin, where an important gas hydrate system is present. The final model can be considered a solid result thanks to the support given by the correlation of the data available. The principal reached objectives of the project can be summarized in the following points:

- 1) Analysis of all geophysical data available, acquired in the South Shetland Margin. We re-processed the available seismic data to obtain an adequate seismic imaging in time and depth domain to allow petrophysical analysis of the data.
- 2) Background velocity of the area, i.e., seismic velocity in absence of hydrate and free gas in the pore space.
- 2) Characteristics and spatial variability of hydrate in the margin. By using inversion method of seismic reflected events and theoretical models, we estimated the gas hydrate and free gas concentrations in the pore space and the thickness of the hydrate and free gas zone. This step was obtained by using the software ISTRICI and DRAGO produced in the frame of IGEOS project.
- 3) 3D models. Interpolating the 2D seismic velocity and 2D gas-phase sections, we obtained a 3D model of the hydrate system. Considering an area of 410 km^2 , the gas volume trapped in the sediments was estimated about $16 \cdot 10^9 \text{ m}^3$. Supposing that 1 m^3 of gas in situ produces 140 m^3 gas in standard condition, the studied hydrate system contains $2.3 \cdot 10^{12} \text{ m}^3$ of gas in standard condition.
- 4) Slope stability studies. The elastic models obtained by seismic analysis were used to study the slope stability versus climate change. The simulations suggested that the free gas thickness strongly influences the slope stability of the margin.
- 5) Simulation of the effects of the variation of the sea level. We reconstructed several elastic models supposing 100 m sea level change and a sea bottom temperature change of 1°C , in agreement with the literature. The results indicated that the slope stability is mainly influenced at the beginning of the global warming. In addition, a rapid drop of the sea level change can significantly influence the stability of the margin.
- 6) Integration of results by using GIS. All the results and products obtained in IGEOS were included in a GIS project. Integrating results and data, we recognized several features related to gas hydrate presence, such as mud volcanoes, fluid expulsions. Moreover, we observed that the highest hydrate concentration has been found in proximity of the major faults.

The results of the IGEOS project have been published in several international journals and in a special issue dedicated to gas hydrate in continental margin, organized by the leader of the IGEOS project.

It is important to mention that the project reinforced the collaboration with the Korean Polar Research Institute (KOPRI), formalised by the Memorandum of Understanding between OGS and KOPRI. Moreover, the leader of IGEOS participated to the Korean Antarctic leg in the South Shetland margin in order to

share data and knowledge.

F – patents, prototypes and data bases

In the frame of the IGEOS project, five structures have been identified offshore the South Shetland Margin. So, the 7th december 2007 we named three mud vollcanoes (Flop, Sernio and Vualt) and a structural high named Cjavalz. The 15th may 2008, the mud volcano Grauzaria was certified.

IGEOS project implemented a GIS project in which all the results have been included.

Two softwares have been created: ISTRICI and DRAGO. The first one is used to determine the velocity by Common Image Gather analysis and the second one is dedicated to estimate the gas hydrate, the free gas and the pore pressure by seismic velocity by using theoretical approch.

G – exhibits, organization of conferences, editing and similar

GEOITALIA 2007 – section T02: Gas hydrate: from impact to environment to possible energy resource. Organized by Tinivella and Fontana

GEOITALIA 2009 – section D1: Gas hydrate: from impact to environment to possible energy resource. Organized by Tinivella and Fontana

Workshop Italy- Korea 2008. Organized by Tinivella in order to promote collaboration between italian scientific community and the KOPRI (Korea). In this context, a Memorandum of Understanding between OGS and KOPRI was signed.

OMC 2009 - Workshop "Energy from methane hydrates - Resource potential and technology challanges". Organized by Tinivella and Ruben

Workshop 2009 – Workshop organized in the frame of the IGEOS project, in order to pianify collaboration with Korean colleagues.

EGU 2010 – section ERE1.4: "Gas-hydrates, petroleum and coal - Resources and hazards". Organized by V. Kutcherov, A. Shapiro, U. Tinivella, K. Sain, and U. Meyer

Fiery Ice Workshop 2010 – Tinivella was member of Scientific Commity and organised in collaboration with R. Coffin the section: Polar gas hydrate.

2011 – Lead Guest Editor of the Special Issue "Gas Hydrate on Continenatl Margins (JGR)". Guest editor: M. Giustiniani, X. Liu e I. Pecher (<http://www.hindawi.com/journals/jgr/si/ghcm.html>).

H - formation (PhD thesis, research fellowships, etc.)

2009 – PhD in Science of marine and coastal ebvironment (University of Trieste). The target area is the Antarctic Peninsula and Southern Chilean Margin.

2009 – Installation and training at the NGRI (India) of the software ISTRICI produced and used in the frame of the IGEOS project.

2010 – Invated lesson at "Symposium on Non-Conventional Energy Generation from Coal and Gas Hydrates", Porto Alegre (Brasil), titled:"An approach to characterise the gas hydrate reservoir by geophysical analysis"
